# 1 Ordinary Differential Equations

## 1.1 First-Order ODEs

**Definition 1.1.** A first-order ODE has the form:

$$\frac{dy}{dx} = f(x, y)$$

### 1.1.1 Separable Equations

**Definition 1.2.** A separable equation has the form:

$$\frac{dy}{dx} = g(x)h(y)$$

Solution:  $\int \frac{dy}{h(y)} = \int g(x) dx + C$

### 1.1.2 Linear Equations

**Definition 1.3.** A linear first-order ODE has the form:

$$\frac{dy}{dx} + P(x)y = Q(x)$$

Solution:  $y = e^{-\int P(x) dx} \left[ \int Q(x)e^{\int P(x) dx} dx + C \right]$

### 1.1.3 Exact Equations

**Definition 1.4.** An equation  $M(x, y) dx + N(x, y) dy = 0$  is exact if  $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$ .

## 1.2 Second-Order Linear ODEs

**Definition 1.5.** A second-order linear ODE has the form:

$$a(x)\frac{d^2y}{dx^2} + b(x)\frac{dy}{dx} + c(x)y = f(x)$$

### 1.2.1 Homogeneous Case

For  $f(x) = 0$ , the general solution is:

$$y = c_1y_1(x) + c_2y_2(x)$$

where  $y_1$  and  $y_2$  are linearly independent solutions.

### 1.2.2 Characteristic Equation

For constant coefficients  $ay'' + by' + cy = 0$ :

$$ar^2 + br + c = 0$$

- Two real roots:  $y = c_1e^{r_1x} + c_2e^{r_2x}$
- One real root:  $y = (c_1 + c_2x)e^{rx}$
- Complex roots:  $y = e^{\alpha x}(c_1 \cos \beta x + c_2 \sin \beta x)$

## 1.3 Systems of ODEs

**Definition 1.6.** A system of first-order ODEs:

$$\frac{d\mathbf{x}}{dt} = \mathbf{f}(t, \mathbf{x})$$

where  $\mathbf{x} = (x_1, \dots, x_n)^T$ .

### 1.3.1 Linear Systems

For  $\frac{d\mathbf{x}}{dt} = A\mathbf{x}$ :

$$\mathbf{x}(t) = e^{At}\mathbf{x}_0$$

where  $e^{At}$  is the matrix exponential.

Figure 1: Phase portraits for linear systems

## 2 Existence and Uniqueness

### 2.1 Picard-Lindelöf Theorem

**Theorem 2.1.** If  $f(t, y)$  is continuous and Lipschitz in  $y$  on a rectangle  $R$ , then the IVP:

$$\frac{dy}{dt} = f(t, y), \quad y(t_0) = y_0$$

has a unique solution on some interval containing  $t_0$ .

### 2.2 Lipschitz Condition

**Definition 2.1.** A function  $f(t, y)$  satisfies a Lipschitz condition if:

$$|f(t, y_1) - f(t, y_2)| \leq L|y_1 - y_2|$$

for some constant  $L > 0$ .

## 3 Stability Theory

### 3.1 Equilibrium Points

**Definition 3.1.** An equilibrium point of  $\frac{dx}{dt} = f(x)$  is a point  $x^*$  such that  $f(x^*) = 0$ .

### 3.2 Linear Stability Analysis

**Definition 3.2.** For a linear system  $\frac{dx}{dt} = Ax$ , the stability is determined by the eigenvalues of  $A$ :

- All eigenvalues have negative real parts: asymptotically stable
- Any eigenvalue has positive real part: unstable
- Zero real parts: need further analysis

### 3.3 Lyapunov Stability

**Definition 3.3.** An equilibrium point  $x^*$  is:

- **Stable** if for every  $\epsilon > 0$ , there exists  $\delta > 0$  such that  $|x(0) - x^*| < \delta$  implies  $|x(t) - x^*| < \epsilon$  for all  $t \geq 0$
- **Asymptotically stable** if it's stable and  $\lim_{t \rightarrow \infty} x(t) = x^*$

### 3.4 Lyapunov's Method

**Theorem 3.1.** If there exists a Lyapunov function  $V(x)$  such that:

- $V(x^*) = 0$  and  $V(x) > 0$  for  $x \neq x^*$
- $\dot{V}(x) \leq 0$  for all  $x$

then  $x^*$  is stable. If  $\dot{V}(x) < 0$  for  $x \neq x^*$ , then  $x^*$  is asymptotically stable.

## 4 Partial Differential Equations

### 4.1 Classification

**Definition 4.1.** A second-order linear PDE in two variables:

$$A \frac{\partial^2 u}{\partial x^2} + B \frac{\partial^2 u}{\partial x \partial y} + C \frac{\partial^2 u}{\partial y^2} + D \frac{\partial u}{\partial x} + E \frac{\partial u}{\partial y} + Fu = G$$

is classified by the discriminant  $\Delta = B^2 - 4AC$ :

- $\Delta > 0$ : Hyperbolic
- $\Delta = 0$ : Parabolic
- $\Delta < 0$ : Elliptic

## 4.2 Wave Equation

**Definition 4.2.** The wave equation:

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$$

General solution:  $u(x, t) = f(x - ct) + g(x + ct)$

## 4.3 Heat Equation

**Definition 4.3.** The heat equation:

$$\frac{\partial u}{\partial t} = \alpha \frac{\partial^2 u}{\partial x^2}$$

Solution by separation of variables:  $u(x, t) = X(x)T(t)$

## 4.4 Laplace's Equation

**Definition 4.4.** Laplace's equation:

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

Solutions are harmonic functions.

# 5 Method of Characteristics

## 5.1 First-Order PDEs

**Definition 5.1.** For the PDE  $a(x, y, u) \frac{\partial u}{\partial x} + b(x, y, u) \frac{\partial u}{\partial y} = c(x, y, u)$ , the characteristic equations are:

$$\frac{dx}{ds} = a, \quad \frac{dy}{ds} = b, \quad \frac{du}{ds} = c$$

# 6 Green's Functions

## 6.1 Definition

**Definition 6.1.** A Green's function  $G(x, \xi)$  for the operator  $L$  satisfies:

$$LG(x, \xi) = \delta(x - \xi)$$

where  $\delta$  is the Dirac delta function.

## 6.2 Solution Representation

**Theorem 6.1.** If  $Lu = f$  with homogeneous boundary conditions, then:

$$u(x) = \int G(x, \xi) f(\xi) d\xi$$

## 7 Fourier Methods

### 7.1 Fourier Series

**Definition 7.1.** For a periodic function  $f(x)$  with period  $2L$ :

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left( a_n \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right)$$

where:

$$a_n = \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx$$
$$b_n = \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx$$

### 7.2 Fourier Transform

**Definition 7.2.** The Fourier transform of  $f(x)$  is:

$$\hat{f}(\xi) = \int_{-\infty}^{\infty} f(x) e^{-2\pi i \xi x} dx$$

Inverse transform:

$$f(x) = \int_{-\infty}^{\infty} \hat{f}(\xi) e^{2\pi i \xi x} d\xi$$

## 8 Applications

### 8.1 Physics

Differential equations model:

- Classical mechanics (Newton's laws)
- Electromagnetism (Maxwell's equations)
- Quantum mechanics (Schrödinger equation)
- Fluid dynamics (Navier-Stokes equations)

### 8.2 Biology

Applications include:

- Population dynamics
- Epidemiology
- Chemical kinetics
- Neural networks

### 8.3 Engineering

Used in:

- Control systems
- Signal processing
- Heat transfer
- Structural analysis

## 9 Important Theorems

### 9.1 Existence and Uniqueness for Systems

**Theorem 9.1.** If  $\mathbf{f}(t, \mathbf{x})$  is continuous and satisfies a Lipschitz condition in  $\mathbf{x}$  on a domain  $D$ , then the IVP  $\frac{d\mathbf{x}}{dt} = \mathbf{f}(t, \mathbf{x})$ ,  $\mathbf{x}(t_0) = \mathbf{x}_0$  has a unique solution.

### 9.2 Sturm-Liouville Theory

**Theorem 9.2.** For the Sturm-Liouville problem:

$$-\frac{d}{dx} \left[ p(x) \frac{dy}{dx} \right] + q(x)y = \lambda w(x)y$$

with appropriate boundary conditions, the eigenvalues are real and the eigenfunctions are orthogonal.

### 9.3 Maximum Principle

**Theorem 9.3.** For Laplace's equation in a bounded domain, the maximum and minimum values occur on the boundary.

## 10 Numerical Methods

### 10.1 Finite Differences

**Definition 10.1.** Finite difference approximations:

- Forward:  $f'(x) \approx \frac{f(x+h)-f(x)}{h}$
- Backward:  $f'(x) \approx \frac{f(x)-f(x-h)}{h}$
- Central:  $f'(x) \approx \frac{f(x+h)-f(x-h)}{2h}$

### 10.2 Finite Elements

**Definition 10.2.** The finite element method approximates the solution by piecewise polynomial functions on a mesh.
