# 1 Introduction to Cryptography

Cryptography is the science of secure communication in the presence of adversaries. It encompasses techniques for protecting information confidentiality, ensuring data integrity, authenticating parties, and providing non-repudiation.

## 1.1 Basic Concepts

**Definition 1.1** (Cryptography). *Cryptography is the practice and study of techniques for secure communication in the presence of third parties called adversaries.*

**Definition 1.2** (Cryptosystem). *A cryptosystem is a tuple  $(P, C, K, E, D)$  where:*

- $P$  is the set of plaintexts
- $C$  is the set of ciphertexts
- $K$  is the set of keys
- $E$  is the set of encryption functions
- $D$  is the set of decryption functions

## 1.2 Security Goals

1. **Confidentiality:** Information is accessible only to authorized parties
2. **Integrity:** Information cannot be modified without detection
3. **Authentication:** Verification of identity of communicating parties
4. **Non-repudiation:** Prevention of denial of participation in communication

## 1.3 Types of Cryptography

1. **Symmetric Cryptography:** Same key for encryption and decryption
2. **Asymmetric Cryptography:** Different keys for encryption and decryption
3. **Hash Functions:** One-way functions for data integrity
4. **Digital Signatures:** Authentication and non-repudiation

# 2 Mathematical Foundations

## 2.1 Number Theory

### 2.1.1 Modular Arithmetic

**Definition 2.1** (Modular Arithmetic). *For integers  $a$ ,  $b$ , and  $n > 0$ :*

$$a \equiv b \pmod{n} \iff n \mid (a - b)$$

**Theorem 2.2** (Properties of Modular Arithmetic). *For integers  $a$ ,  $b$ ,  $c$ , and  $n > 0$ :*

1.  $(a + b) \bmod n = ((a \bmod n) + (b \bmod n)) \bmod n$
2.  $(a \cdot b) \bmod n = ((a \bmod n) \cdot (b \bmod n)) \bmod n$
3.  $(a^b) \bmod n = ((a \bmod n)^b) \bmod n$

### 2.1.2 Greatest Common Divisor

**Definition 2.3** (GCD). *The greatest common divisor of integers  $a$  and  $b$  is the largest integer  $d$  such that  $d \mid a$  and  $d \mid b$ .*

---

#### Algorithm 1 Extended Euclidean Algorithm

---

**Require:** Integers  $a, b$  with  $a \geq b \geq 0$

**Ensure:** Integers  $d, x, y$  such that  $d = \gcd(a, b) = ax + by$

```

1: if  $b = 0$  then
2:   return  $(a, 1, 0)$ 
3: else
4:    $(d', x', y') \leftarrow \text{ExtendedEuclidean}(b, a \bmod b)$ 
5:    $d \leftarrow d'$ 
6:    $x \leftarrow y'$ 
7:    $y \leftarrow x' - \lfloor a/b \rfloor \cdot y'$ 
8:   return  $(d, x, y)$ 
9: end if

```

---

### 2.1.3 Modular Inverse

**Definition 2.4** (Modular Inverse). *For integers  $a$  and  $n$ , the modular inverse of  $a$  modulo  $n$  is an integer  $x$  such that:*

$$ax \equiv 1 \pmod{n}$$

**Proposition 2.5** (Existence of Modular Inverse). *The modular inverse of  $a$  modulo  $n$  exists if and only if  $\gcd(a, n) = 1$ .*

## 2.2 Finite Fields

**Definition 2.6** (Finite Field). *A finite field  $\mathbb{F}_q$  is a field with  $q$  elements where  $q = p^n$  for prime  $p$  and integer  $n \geq 1$ .*

**Theorem 2.7** (Finite Field Properties). *For finite field  $\mathbb{F}_q$ :*

1. *The multiplicative group  $\mathbb{F}_q^*$  is cyclic*
2. *For any  $a \in \mathbb{F}_q$ :  $a^q = a$*
3. *For any  $a \in \mathbb{F}_q^*$ :  $a^{q-1} = 1$*

## 2.3 Elliptic Curves

**Definition 2.8** (Elliptic Curve). *An elliptic curve over field  $K$  is defined by the Weierstrass equation:*

$$y^2 = x^3 + ax + b$$

*where  $a, b \in K$  and  $\Delta = -16(4a^3 + 27b^2) \neq 0$ .*

**Definition 2.9** (Elliptic Curve Group Law). *For points  $P = (x_1, y_1)$  and  $Q = (x_2, y_2)$  on elliptic curve  $E$ :*

$$P + Q = \begin{cases} \mathcal{O} & \text{if } P = -Q \\ (x_3, y_3) & \text{otherwise} \end{cases} \quad (1)$$

where:

$$x_3 = \lambda^2 - x_1 - x_2 \quad (2)$$

$$y_3 = \lambda(x_1 - x_3) - y_1 \quad (3)$$

$$\lambda = \begin{cases} \frac{y_2 - y_1}{x_2 - x_1} & \text{if } P \neq Q \\ \frac{3x_1^2 + a}{2y_1} & \text{if } P = Q \end{cases} \quad (4)$$

## 3 Symmetric Cryptography

### 3.1 Block Ciphers

**Definition 3.1** (Block Cipher). *A block cipher is a deterministic algorithm operating on fixed-length groups of bits (blocks) with an unvarying transformation specified by a symmetric key.*

#### 3.1.1 Data Encryption Standard (DES)

**Definition 3.2** (DES). *DES is a 64-bit block cipher with 56-bit key using Feistel network structure.*

---

##### Algorithm 2 DES Encryption

---

- 1: Split 64-bit plaintext into  $L_0$  and  $R_0$  (32 bits each)
  - 2: **for**  $i = 1$  to 16 **do**
  - 3:    $L_i \leftarrow R_{i-1}$
  - 4:    $R_i \leftarrow L_{i-1} \oplus F(R_{i-1}, K_i)$
  - 5: **end for**
  - 6: Ciphertext  $\leftarrow R_{16} \| L_{16}$
- 

#### 3.1.2 Advanced Encryption Standard (AES)

**Definition 3.3** (AES). *AES is a 128-bit block cipher with key sizes of 128, 192, or 256 bits using substitution-permutation network.*

---

##### Algorithm 3 AES Round Function

---

- 1: **SubBytes**: Apply S-box to each byte
  - 2: **ShiftRows**: Cyclically shift rows
  - 3: **MixColumns**: Mix columns using matrix multiplication
  - 4: **AddRoundKey**: XOR with round key
- 

### 3.2 Stream Ciphers

**Definition 3.4** (Stream Cipher). *A stream cipher is a symmetric key cipher where plaintext digits are combined with a pseudorandom cipher digit stream (keystream).*

#### 3.2.1 Linear Feedback Shift Register (LFSR)

**Definition 3.5** (LFSR). *An LFSR is a shift register whose input bit is a linear function of its previous state.*

---

**Algorithm 4** LFSR Generation

---

```
1: Initialize register with seed value
2: for each clock cycle do
3:   Output least significant bit
4:   Compute feedback bit as XOR of selected taps
5:   Shift register right and insert feedback bit
6: end for
```

---

### 3.3 Modes of Operation

#### 3.3.1 Electronic Codebook (ECB)

**Definition 3.6** (ECB Mode). *In ECB mode, each plaintext block is encrypted independently using the same key.*

#### 3.3.2 Cipher Block Chaining (CBC)

**Definition 3.7** (CBC Mode). *In CBC mode, each plaintext block is XORed with the previous ciphertext block before encryption.*

---

**Algorithm 5** CBC Encryption

---

```
1:  $C_0 \leftarrow IV$  (initialization vector)
2: for  $i = 1$  to  $n$  do
3:    $C_i \leftarrow E_K(P_i \oplus C_{i-1})$ 
4: end for
```

---

#### 3.3.3 Counter (CTR) Mode

**Definition 3.8** (CTR Mode). *In CTR mode, a counter is encrypted to produce a keystream, which is XORed with the plaintext.*

## 4 Asymmetric Cryptography

### 4.1 RSA Cryptosystem

**Definition 4.1** (RSA). *RSA is an asymmetric cryptosystem based on the difficulty of factoring large integers.*

---

**Algorithm 6** RSA Key Generation

---

```
1: Choose two large primes  $p$  and  $q$ 
2: Compute  $n = pq$  and  $\phi(n) = (p-1)(q-1)$ 
3: Choose  $e$  such that  $\gcd(e, \phi(n)) = 1$ 
4: Compute  $d$  such that  $ed \equiv 1 \pmod{\phi(n)}$ 
5: Public key:  $(n, e)$ , Private key:  $(n, d)$ 
```

---

**Theorem 4.2** (RSA Correctness). *For RSA cryptosystem with public key  $(n, e)$  and private key  $(n, d)$ :*

$$(m^e)^d \equiv m \pmod{n}$$

*for any message  $m$  with  $0 \leq m < n$ .*

---

**Algorithm 7** RSA Encryption/Decryption

---

- 1: **Encryption:**  $c \equiv m^e \pmod{n}$
  - 2: **Decryption:**  $m \equiv c^d \pmod{n}$
- 

## 4.2 Diffie-Hellman Key Exchange

**Definition 4.3** (Diffie-Hellman). *Diffie-Hellman is a method for securely exchanging cryptographic keys over a public channel.*

---

**Algorithm 8** Diffie-Hellman Key Exchange

---

- 1: Alice and Bob agree on prime  $p$  and generator  $g$
  - 2: Alice chooses secret  $a$ , sends  $A = g^a \pmod{p}$  to Bob
  - 3: Bob chooses secret  $b$ , sends  $B = g^b \pmod{p}$  to Alice
  - 4: Alice computes  $K = B^a \pmod{p}$
  - 5: Bob computes  $K = A^b \pmod{p}$
  - 6: Shared secret:  $K = g^{ab} \pmod{p}$
- 

## 4.3 Elliptic Curve Cryptography (ECC)

**Definition 4.4** (Elliptic Curve Discrete Logarithm Problem). *Given elliptic curve  $E$ , point  $P$ , and point  $Q = kP$ , find integer  $k$ .*

---

**Algorithm 9** ECDH Key Exchange

---

- 1: Alice and Bob agree on elliptic curve  $E$  and base point  $G$
  - 2: Alice chooses secret  $a$ , sends  $A = aG$  to Bob
  - 3: Bob chooses secret  $b$ , sends  $B = bG$  to Alice
  - 4: Alice computes  $K = aB$
  - 5: Bob computes  $K = bA$
  - 6: Shared secret:  $K = abG$
- 

## 5 Hash Functions

### 5.1 Properties of Hash Functions

**Definition 5.1** (Cryptographic Hash Function). *A cryptographic hash function  $H : \{0, 1\}^* \rightarrow \{0, 1\}^n$  should satisfy:*

1. **Preimage resistance:** *Given  $h$ , hard to find  $m$  such that  $H(m) = h$*
2. **Second preimage resistance:** *Given  $m$ , hard to find  $m' \neq m$  such that  $H(m) = H(m')$*
3. **Collision resistance:** *Hard to find any  $m, m'$  such that  $H(m) = H(m')$*

### 5.2 SHA Family

#### 5.2.1 SHA-1

**Definition 5.2** (SHA-1). *SHA-1 produces a 160-bit hash value and operates on 512-bit blocks.*

---

**Algorithm 10** SHA-1 Processing

---

- 1: Pad message to multiple of 512 bits
  - 2: Initialize hash values  $h_0, h_1, h_2, h_3, h_4$
  - 3: **for** each 512-bit block **do**
  - 4:   Break block into 16 32-bit words
  - 5:   Extend to 80 words using recurrence relation
  - 6:   Process through 80 rounds with different functions
  - 7:   Update hash values
  - 8: **end for**
  - 9: Output 160-bit hash
- 

### 5.2.2 SHA-256

**Definition 5.3** (SHA-256). *SHA-256 produces a 256-bit hash value and operates on 512-bit blocks.*

## 5.3 Merkle-Damgård Construction

**Definition 5.4** (Merkle-Damgård). *The Merkle-Damgård construction builds a collision-resistant hash function from a collision-resistant compression function.*

---

**Algorithm 11** Merkle-Damgård Construction

---

- 1: Pad message  $M$  to length multiple of block size
  - 2: Initialize  $h_0 = IV$
  - 3: **for** each block  $M_i$  **do**
  - 4:    $h_i = f(h_{i-1}, M_i)$
  - 5: **end for**
  - 6: Output  $h_n$
- 

## 6 Digital Signatures

### 6.1 RSA Signatures

---

**Algorithm 12** RSA Signature Generation

---

- 1: Compute hash  $h = H(m)$  of message  $m$
  - 2: Generate signature  $s = h^d \bmod n$
  - 3: Send  $(m, s)$
- 

### 6.2 Elliptic Curve Digital Signature Algorithm (ECDSA)

## 7 Key Management

### 7.1 Key Distribution

**Definition 7.1** (Key Distribution Problem). *The key distribution problem is how to securely share cryptographic keys between communicating parties.*

---

**Algorithm 13** RSA Signature Verification

---

- 1: Compute hash  $h = H(m)$  of received message  $m$
  - 2: Compute  $h' = s^e \bmod n$
  - 3: Accept if  $h = h'$ , reject otherwise
- 

---

**Algorithm 14** ECDSA Signature Generation

---

- 1: Compute hash  $h = H(m)$  of message  $m$
  - 2: Choose random  $k$  with  $1 \leq k < n$
  - 3: Compute  $R = kG = (x_R, y_R)$
  - 4: Compute  $r = x_R \bmod n$
  - 5: Compute  $s = k^{-1}(h + rd) \bmod n$
  - 6: Signature:  $(r, s)$
- 

### 7.1.1 Key Distribution Centers (KDC)

## 7.2 Public Key Infrastructure (PKI)

**Definition 7.2** (PKI). *A PKI is a framework for managing digital certificates and public-private key pairs.*

**Definition 7.3** (Digital Certificate). *A digital certificate binds a public key to an identity and is signed by a Certificate Authority (CA).*

## 7.3 Perfect Forward Secrecy

**Definition 7.4** (Perfect Forward Secrecy). *Perfect forward secrecy ensures that compromise of long-term keys does not compromise past session keys.*

# 8 Protocols and Applications

## 8.1 Transport Layer Security (TLS)

## 8.2 Secure Shell (SSH)

**Definition 8.1** (SSH). *SSH is a cryptographic network protocol for secure remote login and file transfer.*

## 8.3 IPSec

**Definition 8.2** (IPSec). *IPSec is a suite of protocols for securing Internet Protocol communications.*

---

**Algorithm 15** ECDSA Signature Verification

---

- 1: Compute hash  $h = H(m)$  of message  $m$
  - 2: Compute  $u_1 = hs^{-1} \bmod n$  and  $u_2 = rs^{-1} \bmod n$
  - 3: Compute  $R = u_1G + u_2Q = (x_R, y_R)$
  - 4: Accept if  $r = x_R \bmod n$ , reject otherwise
-

---

**Algorithm 16** KDC Protocol

---

- 1: Alice requests session key with Bob from KDC
  - 2: KDC generates random session key  $K_{AB}$
  - 3: KDC sends  $E_{K_A}(K_{AB})$  to Alice
  - 4: KDC sends  $E_{K_B}(K_{AB})$  to Bob
  - 5: Alice and Bob use  $K_{AB}$  for secure communication
- 

---

**Algorithm 17** TLS Handshake

---

- 1: Client sends ClientHello with supported cipher suites
  - 2: Server sends ServerHello with chosen cipher suite
  - 3: Server sends certificate and ServerHelloDone
  - 4: Client verifies certificate and sends ClientKeyExchange
  - 5: Both parties compute master secret and session keys
  - 6: Client and server send ChangeCipherSpec and Finished
- 

## 8.4 PGP/GPG

**Definition 8.3** (PGP). *Pretty Good Privacy (PGP) is a data encryption and decryption program providing cryptographic privacy and authentication.*

## 9 Advanced Topics

### 9.1 Quantum Cryptography

**Definition 9.1** (Quantum Key Distribution). *Quantum key distribution uses quantum mechanics to guarantee secure key exchange.*

#### 9.1.1 BB84 Protocol

---

**Algorithm 18** BB84 Protocol

---

- 1: Alice generates random bit string and basis choices
  - 2: Alice sends qubits encoded in chosen bases
  - 3: Bob measures qubits in random bases
  - 4: Alice and Bob announce basis choices
  - 5: Alice and Bob discard bits where bases don't match
  - 6: Alice and Bob perform error correction and privacy amplification
- 

### 9.2 Homomorphic Encryption

**Definition 9.2** (Homomorphic Encryption). *Homomorphic encryption allows computation on encrypted data without decrypting it.*

**Definition 9.3** (Fully Homomorphic Encryption). *Fully homomorphic encryption supports arbitrary computation on encrypted data.*

### 9.3 Multi-Party Computation

**Definition 9.4** (Secure Multi-Party Computation). *Secure multi-party computation allows parties to jointly compute a function over their inputs while keeping those inputs private.*

## 9.4 Zero-Knowledge Proofs

**Definition 9.5** (Zero-Knowledge Proof). *A zero-knowledge proof is a method by which one party (the prover) can prove to another party (the verifier) that they know a value  $x$  without conveying any information apart from the fact that they know the value  $x$ .*

### 9.4.1 Properties of Zero-Knowledge Proofs

**Definition 9.6** (Completeness). *If the statement is true, the honest verifier will be convinced by an honest prover.*

**Definition 9.7** (Soundness). *If the statement is false, no cheating prover can convince the honest verifier that it is true, except with some small probability.*

**Definition 9.8** (Zero-Knowledge). *If the statement is true, no verifier learns anything other than the fact that the statement is true.*

### 9.4.2 Interactive Proof Systems

**Definition 9.9** (Interactive Proof System). *An interactive proof system is a protocol between a prover and verifier where the prover convinces the verifier of the truth of a statement through multiple rounds of interaction.*

---

**Algorithm 19** Interactive Zero-Knowledge Proof Protocol

---

- 1: Prover commits to secret using commitment scheme
  - 2: Verifier sends random challenge  $c$
  - 3: Prover responds  $r$  based on challenge and secret
  - 4: Verifier checks response against commitment
  - 5: Repeat  $k$  rounds until desired confidence level
- 

### 9.4.3 Non-Interactive Zero-Knowledge Proofs

**Definition 9.10** (Non-Interactive Zero-Knowledge Proof). *A non-interactive zero-knowledge proof requires no interaction between prover and verifier, using a common reference string or random oracle.*

**Theorem 9.11** (Fiat-Shamir Transformation). *Any public-coin interactive proof can be converted to a non-interactive proof using the Fiat-Shamir heuristic with a random oracle.*

### 9.4.4 Succinct Non-Interactive Arguments of Knowledge (SNARKs)

**Definition 9.12** (SNARK). *A SNARK is a non-interactive zero-knowledge proof system where the proof size and verification time are sublinear in the size of the computation being proven.*

**Definition 9.13** (Arithmetic Circuit). *An arithmetic circuit is a directed acyclic graph where each node performs an arithmetic operation (addition or multiplication) on field elements.*

### 9.4.5 zk-SNARKs

**Definition 9.14** (zk-SNARK). *A zk-SNARK is a zero-knowledge Succinct Non-interactive Argument of Knowledge that provides privacy and succinctness.*

1. **QAP (Quadratic Arithmetic Program)**: Convert circuit to polynomial constraints

---

**Algorithm 20** SNARK Construction

---

- 1: Convert computation to arithmetic circuit
  - 2: Generate proving key and verification key
  - 3: Prover computes witness for circuit satisfiability
  - 4: Prover generates proof using proving key
  - 5: Verifier checks proof using verification key
- 

2. **Trusted Setup:** Generate proving and verification keys
3. **Proof Generation:** Create proof of circuit satisfiability
4. **Proof Verification:** Verify proof without revealing witness

#### 9.4.6 zk-STARKs

**Definition 9.15** (zk-STARK). *A zk-STARK is a zero-knowledge Scalable Transparent Argument of Knowledge that requires no trusted setup.*

---

**Algorithm 21** zk-STARK Construction

---

- 1: Convert computation to algebraic intermediate representation
  - 2: Generate execution trace and constraints
  - 3: Apply FRI (Fast Reed-Solomon Interactive Oracle Proofs)
  - 4: Generate proof without trusted setup
  - 5: Verify proof using public randomness
- 

#### 9.4.7 Bulletproofs

**Definition 9.16** (Bulletproof). *A Bulletproof is a non-interactive zero-knowledge proof protocol that allows a prover to convince a verifier that a committed value lies within a given range.*

**Theorem 9.17** (Range Proof). *Bulletproofs can prove that a committed value  $v$  satisfies  $0 \leq v < 2^n$  for any positive integer  $n$ .*

#### 9.4.8 Applications of Zero-Knowledge Proofs

1. **Authentication:** Prove identity without revealing credentials
2. **Blockchain Privacy:** Private transactions in cryptocurrencies
3. **Compliance:** Prove regulatory compliance without revealing sensitive data
4. **Decentralized Identity:** Anonymous credentials and selective disclosure
5. **Private Computation:** Prove computation results without revealing inputs
6. **Supply Chain:** Prove product authenticity without revealing trade secrets

#### 9.4.9 Commitment Schemes

**Definition 9.18** (Commitment Scheme). *A commitment scheme allows a party to commit to a chosen value while keeping it hidden until they reveal it.*

---

**Algorithm 22** Pedersen Commitment

---

- 1: Choose generators  $g, h$  of group  $G$  with prime order  $p$
  - 2: To commit to value  $v$ :  $C = g^v h^r$  where  $r$  is random
  - 3: To open: reveal  $(v, r)$
  - 4: Verification: check  $C = g^v h^r$
- 

#### 9.4.10 Sigma Protocols

**Definition 9.19** (Sigma Protocol). *A Sigma protocol is a three-move interactive proof system: commitment, challenge, response.*

---

**Algorithm 23** Schnorr Identification Protocol

---

- 1: Prover chooses random  $k$ , sends  $R = g^k$
  - 2: Verifier sends random challenge  $c$
  - 3: Prover sends  $s = k + cx$  where  $x$  is secret key
  - 4: Verifier checks  $g^s = R \cdot y^c$  where  $y = g^x$  is public key
- 

#### 9.4.11 Proof Composition

**Definition 9.20** (Proof Composition). *Proof composition allows combining multiple zero-knowledge proofs into a single proof.*

1. **AND Composition:** Prove multiple statements simultaneously
2. **OR Composition:** Prove at least one of several statements
3. **Proof Recursion:** Use proofs to verify other proofs

#### 9.4.12 Trusted Setup

**Definition 9.21** (Trusted Setup). *A trusted setup is a ceremony where secret parameters are generated and then destroyed, leaving only public parameters.*

**Definition 9.22** (Universal Setup). *A universal setup can be used for any circuit of a given size, rather than requiring a new setup for each circuit.*

#### 9.4.13 Post-Quantum Zero-Knowledge

**Definition 9.23** (Post-Quantum Zero-Knowledge). *Post-quantum zero-knowledge proofs are resistant to attacks by quantum computers.*

1. **Lattice-based:** Using lattice problems for security
2. **Code-based:** Using error-correcting codes
3. **Multivariate:** Using systems of multivariate equations
4. **Isogeny-based:** Using elliptic curve isogenies

## 10 Cryptanalysis

### 10.1 Attack Types

1. **Ciphertext-only attack:** Attacker has only ciphertexts
2. **Known-plaintext attack:** Attacker has ciphertexts and corresponding plaintexts
3. **Chosen-plaintext attack:** Attacker can choose plaintexts and obtain ciphertexts
4. **Chosen-ciphertext attack:** Attacker can choose ciphertexts and obtain plaintexts

### 10.2 Statistical Attacks

#### 10.2.1 Frequency Analysis

**Definition 10.1** (Frequency Analysis). *Frequency analysis studies the frequency of letters or groups of letters in ciphertext to break substitution ciphers.*

### 10.3 Mathematical Attacks

#### 10.3.1 Linear Cryptanalysis

**Definition 10.2** (Linear Cryptanalysis). *Linear cryptanalysis exploits linear approximations of the cipher to recover the key.*

#### 10.3.2 Differential Cryptanalysis

**Definition 10.3** (Differential Cryptanalysis). *Differential cryptanalysis studies how differences in input pairs affect differences in output pairs.*

### 10.4 Side-Channel Attacks

**Definition 10.4** (Side-Channel Attack). *Side-channel attacks exploit information leaked through physical implementation of cryptographic systems.*

1. **Timing attacks:** Exploit timing variations in operations
2. **Power analysis:** Exploit power consumption patterns
3. **Electromagnetic analysis:** Exploit electromagnetic emissions
4. **Cache attacks:** Exploit cache access patterns

## 11 Security Models and Proofs

### 11.1 Security Definitions

**Definition 11.1** (Semantic Security). *A cryptosystem is semantically secure if no efficient algorithm can distinguish between encryptions of different messages.*

**Definition 11.2** (Chosen-Plaintext Attack (CPA) Security). *A cryptosystem is CPA-secure if it remains secure even when the attacker can obtain encryptions of chosen plaintexts.*

### 11.2 Random Oracle Model

**Definition 11.3** (Random Oracle). *A random oracle is an ideal hash function that returns truly random responses to unique queries.*

### 11.3 Provable Security

**Theorem 11.4** (Security Reduction). *If problem  $A$  is hard and cryptosystem  $C$  can be broken, then problem  $A$  can be solved efficiently.*

## 12 Implementation Considerations

### 12.1 Secure Random Number Generation

**Definition 12.1** (Cryptographically Secure PRNG). *A cryptographically secure pseudorandom number generator produces output that is computationally indistinguishable from true randomness.*

### 12.2 Constant-Time Implementation

**Definition 12.2** (Constant-Time Algorithm). *A constant-time algorithm takes the same amount of time to execute regardless of input values.*

### 12.3 Memory Management

1. **Secure memory allocation:** Prevent memory leaks of sensitive data
2. **Memory wiping:** Clear sensitive data from memory
3. **Memory protection:** Prevent unauthorized access to sensitive memory regions

## 13 Standards and Regulations

### 13.1 Cryptographic Standards

1. **FIPS 140-2:** Security requirements for cryptographic modules
2. **Common Criteria:** International standard for security evaluation
3. **NIST Guidelines:** Recommendations for cryptographic implementations

### 13.2 Export Controls

**Definition 13.1** (Export Control). *Export controls restrict the export of cryptographic software and hardware to certain countries.*

## 14 Applications

### 14.1 Digital Currency

**Definition 14.1** (Cryptocurrency). *Cryptocurrency is a digital currency secured by cryptography, typically using blockchain technology.*

### 14.2 Blockchain

**Definition 14.2** (Blockchain). *A blockchain is a distributed ledger maintained by a network of nodes using cryptographic techniques.*

### 14.3 Secure Communication

1. **Email encryption:** PGP, S/MIME
2. **Messaging:** Signal, WhatsApp
3. **VoIP:** SRTP, ZRTP

### 14.4 Authentication Systems

1. **Multi-factor authentication:** TOTP, HOTP
2. **Biometric authentication:** Fingerprint, face recognition
3. **Smart cards:** EMV, contactless payments

## 15 Future Directions

### 15.1 Post-Quantum Cryptography

**Definition 15.1** (Post-Quantum Cryptography). *Post-quantum cryptography refers to cryptographic algorithms resistant to attacks by quantum computers.*

#### 15.1.1 Lattice-Based Cryptography

**Definition 15.2** (Lattice Problem). *A lattice problem involves finding short vectors in high-dimensional lattices.*

#### 15.1.2 Code-Based Cryptography

**Definition 15.3** (Code-Based Cryptography). *Code-based cryptography uses error-correcting codes to construct cryptographic primitives.*

### 15.2 Lightweight Cryptography

**Definition 15.4** (Lightweight Cryptography). *Lightweight cryptography provides security for resource-constrained devices.*

### 15.3 Attribute-Based Encryption

**Definition 15.5** (Attribute-Based Encryption). *Attribute-based encryption allows fine-grained access control based on attributes.*

## 16 Key Theorems and Results

**Theorem 16.1** (Shannon's Perfect Secrecy). *A cryptosystem has perfect secrecy if and only if the key is at least as long as the message and used only once.*

**Theorem 16.2** (Goldwasser-Micali Security). *The Goldwasser-Micali cryptosystem is semantically secure under the quadratic residuosity assumption.*

**Theorem 16.3** (ElGamal Security). *The ElGamal cryptosystem is semantically secure under the decisional Diffie-Hellman assumption.*

**Proposition 16.4** (Hash Function Security). *A hash function is collision-resistant if and only if it is second preimage resistant and preimage resistant.*

## 17 Conclusion

Cryptography is a fundamental field that provides the mathematical and algorithmic foundations for secure communication and data protection. The field encompasses:

- **Theoretical foundations:** Number theory, algebra, probability theory
- **Symmetric cryptography:** Block ciphers, stream ciphers, modes of operation
- **Asymmetric cryptography:** RSA, Diffie-Hellman, elliptic curves
- **Hash functions:** SHA family, Merkle-Damgård construction
- **Digital signatures:** RSA, ECDSA, DSA
- **Key management:** Distribution, PKI, perfect forward secrecy
- **Security protocols:** TLS, SSH, IPSec
- **Advanced topics:** Quantum cryptography, homomorphic encryption, zero-knowledge proofs

The field continues to evolve with:

- **Post-quantum cryptography:** Preparing for quantum computing threats
- **Lightweight cryptography:** Securing IoT and embedded devices
- **Privacy-preserving techniques:** Homomorphic encryption, secure multi-party computation
- **Quantum cryptography:** Quantum key distribution and quantum-resistant algorithms

Cryptography remains essential for protecting information in our digital world, balancing security requirements with practical implementation constraints while adapting to emerging threats and technological advances.
